(a) speed and tool time enter only as $s\bar{z}$
peak ratio $\omega_b = \mu^*/\mu_b$
$s\bar{z}$ (s): mean tool time in A100-equivalent seconds
model $\omega_b(c, s\bar{z})$, 300k pool
A100 measured (turns-based)
A100 measured (sessions/s)
H200 frozen prediction (s=2.742)
H200 measured (turns-based; seen before the freeze)
H200 measured (sessions/s)
(b) peak ratio against pool size
peak ratio ω_b
KV pool M (thousand tokens)
A100 measured, in sample (turns-based)
A100 measured, blind in time (turns-based)
model, A100 costs, $\bar{z}$ = 5 s
A100 pool sweep, frozen prediction
H200 measured, seen before the freeze
H200 measured, blind in time
model, H200 costs (s = 2.742)
H200 frozen prediction
